Rest API

What is an API

- An **API** is an application programming interface. It is a set of rules that allow programs to talk to each other. The developer creates the API on the server and allows the client to talk to it

Rest API

- Representational state transfer is a software architectural style that defines a set of constraints to be used for creating Web services.
- Web services that conform to the REST architectural style, called Restful Web services, provide interoperability between computer systems on the internet.

Http Request Methods

HTTP defines a set of **request methods** to indicate the desired action to be performed for a given resource.

PUT : The **PUT** method creates a new resource or replaces a representation of the target resources with the request payload

PATCH : The **PATCH** method is used to apply partial modifications to a resource

DELETE :The **DELETE** method deletes the specified resource
