Rest API

What is an API

➢ An **API** is an application programming interface. It is a set of rules that allow programs to talk to each other. The developer creates the API on the server and allows the client to talk to it

Rest API

➢ Representational state transfer is a software architectural style that defines a set of constraints to be used for creating Web services.
➢ Web services that conform to the REST architectural style, called Restful Web services, provide interoperability between computer systems on the internet.

Http Request Methods

HTTP defines a set of **request methods** to indicate the desired action to be performed for a given resource.

GET : The **GET** method requests a representation of the specified resource. Requests using GET should
only retrieve data

POST : The **POST** method is used to submit an entity to the specified resource, often causing a change
in state or side effects to server

DELETE : The **DELETE** method deletes the specified resource

PUT : The **PUT** method creates a new resource or replaces a representation of the target
resources with the request payload
